Optimize production,
inventory and
on-time performance

A graphic consisting of a cluster of blue hexagons of varying shades. Some hexagons contain white text labels for manufacturing functions: "Product Data Management", "Manufacturing Execution", "Manufacturing Planning", and "Production Scheduler". A large hexagon on the right contains the main title "Manufacturing Management".

Manufacturing Management

Streamline your entire manufacturing processes from production planning and scheduling through sequencing and execution to monitoring and analysis and improve efficiency along your entire value chain.

TIM ERP is designed to ease manufacturing systems management by delivering a fully integrated range of functions:

- Product Data Management
- Manufacturing Planning
- Manufacturing Execution
- Production Scheduler

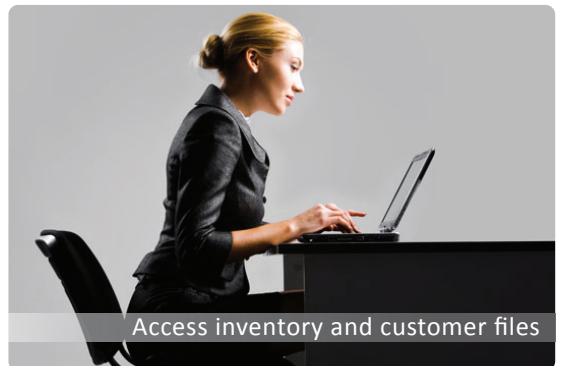

Work Orders

Work Orders is designed for manufacturing firms that require work order processing, component allocation, routing and Material Requirement Planning (MRP) features. Work Orders can be automatically generated from sales order requirements, inventory shortages, or inventory forecast requirements. By defining work centers and operation steps, users can create flexible labor routes.

Production Entry

Production Entry is designed for companies that need bill of materials, sales kit, configuration, or back flush processing, but don't require the allocation of BOM components. It supports unlimited levels of bill of materials and real-time costing from Inventory Module. Modular and variable BOM types are available to handle product configuration issues with speed and flexibility, as well as maintaining fewer BOMs.

Shop Control

Shop Control provides shop floor capacity scheduling, what-if planning capabilities, and WIP tracking for production managers that require Manufacturing Resource Planning (MRPII). It imports open work orders with defined routes, identifies bottlenecks, and calculates work order completion dates. What-if plan orders can be created to view resource requirements without affecting real-time purchasing decisions.

Project Accounting

Project Accounting provides a budget and costing tool for project accounting and job cost management. Its design allows for up to four levels of cost tracking with project, phase, category, and cost-type definition. The job account mask supports the optional use of phases and/or categories and cost-types are user-definable.

Warehouse Manager

Warehouse Manager supports the planning and tracking of inventory movement between warehouse locations.
